

PARENT GUIDE • BEGINNERS BASIC 1

Helping children think clearly, create confidently & learn beyond the classroom.

Coding + Vedic Maths + Cognitive Development

Grade 3+

typically 9–10 years

Weekly

guided learning

15–20 min

light home practice

A practical guide for parents • From first code block to confident creator

Why This Program Matters

PARENT QUICK VIEW

Age	Grade 3+ learners (typically 9–10 years)
Duration	Beginners Basic 1 module with term-wise milestones
Frequency	Weekly guided class + light home practice
Outcomes	Logic, creativity, maths confidence & project portfolio
Support	Structured worksheets, feedback & parent guidance

BIG IDEA FOR PARENTS

Coding teaches children to think in clear steps. A computer follows precise instructions, so children naturally practise logic, sequencing and attention to detail.

1

APP

YouTube Kids, WhatsApp and learning apps are built and run through code.

2

GAME

Every jump, score and level is controlled by coding rules.

3

SIGNAL

Red → yellow → green is an automated sequence, like loop logic.

4

CAR

Modern cars use code for braking, sensors, locking and safety alerts.

5

ROBOT

Home and industrial robots follow coded instructions.

6

TV

Search, recommendations, voice control and streaming depend on code.

DID YOU KNOW? Ada Lovelace is widely recognised as the first computer programmer.

How Coding Builds Thinking

EVERYDAY HUMAN LANGUAGE

"Please bring me a glass of water when you can."

People can infer meaning even when instructions are incomplete.

but

COMPUTER INSTRUCTIONS

"Go to kitchen. Open cupboard. Take glass. Go to filter. Press button. Stop at full."

Computers require exact, sequential directions.

How Coding Helps Your Child

01

Stronger Thinking

Break big problems into manageable steps and solve them with confidence.

02

Creative Expression

Move from consuming content to creating games, stories and animations.

03

Resilience Through Practice

Debug, improve and persist calmly when projects do not work the first time.

04

Better Maths Connection

Loops, patterns and number operations make maths more meaningful in real problem solving.

05

Collaboration Skills

Share projects, exchange feedback and build communication habits.

06

Future Readiness

Technology fluency supports almost every profession, from design and medicine to entrepreneurship.

WHY START NOW?

At ages 9–10, children are highly receptive to structured languages and pattern-based learning. Starting now helps logic and digital fluency feel natural.

What Changes Can Parents Expect?

The goal is not just learning code. It is helping children become more independent, resilient and confident thinkers.

01

More independent problem-solving

Break homework and real-life tasks into clear steps instead of feeling overwhelmed.

02

Healthier response to mistakes

Treat errors as feedback and build a stronger growth mindset.

03

Ability to build ideas into projects

Convert imagination into working games and animations.

04

Clearer communication

Practise precise expression for class participation, presentations and writing.

The bigger outcome

Children begin to see problems as something they can **understand, break down and build**.

Why Vedic Maths + Coding Works

Vedic Maths develops speed and number confidence, while coding develops logic and structure.

WHAT IS VEDIC MATHS?

A method of arithmetic from ancient India that uses 16 concise sutras to simplify calculations and build strong mental maths habits.

Four Ways Vedic Maths Supports Better Coding

Faster Mental Maths

Build number confidence and reduce dependence on calculators.

Better Pattern Recognition

Train the same pattern-recognition ability used in loops and algorithms.

Structured Thinking

Solve complex problems through simple, ordered steps.

Confidence with Numbers

Greater maths confidence can support more active participation in coding and school maths.

THE COMBINATION

Vedic Maths → faster calculation + pattern recognition

Coding → logic + sequencing + creation

Together → stronger computational thinking and confidence.

What Your Child Will Learn

The program starts from zero and uses beginner-friendly visual blocks so every child can build confidence before advanced concepts.

01 Use Scratch with Confidence

- Control sprite movement and appearance
- Design scene changes using backdrops
- Add sounds, music and voice effects

02 Build with Core Code Blocks

- Arrange sequence blocks logically
- Use loops for efficient repetition
- Apply if-else logic for decisions

03 Connect Maths with Coding

- Use variables to track scores and values
- Apply arithmetic using operator blocks
- Use Vedic Maths strategies in coding tasks

04 Build Complete Mini Projects

- A counting game
- An animated short story
- A simple score-based quiz

TAKE-HOME OUTCOME

Your child experiences the confidence of creating projects that move, respond and tell a story — plus a real portfolio of mini-projects to share.

What You Can Observe at Home

01

Confidence with Screens

Shift from passive screen consumption to active creation and ownership.

02

Stronger School Skills

Logic and structure from coding can support maths, science and written work.

03

Calmer, Focused Mind

Short Vedic Maths warm-ups are designed to support focus, working memory and exam readiness.

04

Future-Ready Skills

Coding literacy builds modern learning habits and digital confidence.

05

Healthy Screen Time

06

Habit of Sharing

PARENT TIP

Ask: "What did you create today?"

instead of "What did you study today?" This small change can lead to deeper conversations and stronger reflection.

Parent FAQ

Is Grade 4 too early to start coding?

No. Ages 9–10 are a strong stage for pattern-based thinking. Children can learn sequencing, logic and problem-solving naturally.

Will coding increase my child's screen time?

The goal is to improve screen quality, not random usage. Children move from passive watching to active creation.

What if my child has never coded before?

The program starts from zero with beginner-friendly visual blocks, so children can build confidence before advanced concepts.

Does this help with school academics?

Yes. Coding supports structured thinking and attention to detail, while Vedic Maths supports number speed and problem-solving confidence.

How much home practice is expected?

Usually 15–20 minutes, 2–3 times a week. Tasks are light and practical, focused on revision and small improvements.

Do we need a high-end computer?

No. Basic laptop or desktop access is enough. Most activities run in-browser or on lightweight tools used during class.

How will we know if our child is progressing?

Look for completed mini-projects, worksheets, class feedback and growing confidence while explaining their work.

How can parents support without coding knowledge?

Ask: "What did you create today?", "What problem did you solve?" and "Can you show me your project?"
